Dimensions : 8.49 x 10.97 inches

Pediatric colorectal and pelvic reconstructive surgery is a specialized field of surgery that focuses on treating congenital anomalies and acquired conditions of the colon, rectum, and pelvis in children. These conditions can range from simple to complex, and can affect the child's ability to pass stool, urinate, or have sexual intercourse.

Pediatric colorectal and pelvic reconstructive surgeons are highly trained and experienced in performing these complex procedures. They work closely with other specialists, such as pediatric urologists, pediatric gastroenterologists, and pediatric oncologists, to provide comprehensive care for children with these conditions.

Types of Pediatric Colorectal and Pelvic Reconstructive Surgery

The most common types of pediatric colorectal and pelvic reconstructive surgery include:

* **Anorectal malformations:** These are birth defects that occur when the rectum and anus do not develop properly. There are many different types of anorectal malformations, and the treatment will vary depending on the specific type of malformation. * **Cloacal malformations:** These are rare birth defects that occur when the rectum, vagina, and urethra all open into a common channel. Cloacal malformations can be life-threatening, and require complex surgery to correct. * **Hirschsprung disease:** This is a birth defect that occurs when the nerves that control the colon are not present or are damaged. This can lead to constipation and other problems. Hirschsprung disease is treated with surgery to remove the affected part of the colon. * **Fecal incontinence:** This is the inability to control bowel movements. Fecal incontinence can be caused by a variety of conditions, including spina bifida, cerebral palsy, and spinal cord injuries. Treatment for fecal incontinence may include surgery to improve the function of the anal sphincter muscles. * **Constipation:** This is a common problem in children, and can be caused by a variety of factors, including diet, lifestyle, and medical conditions. Treatment for constipation may include dietary changes, medications, and surgery.

Indications for Surgery

Surgery is typically indicated for children with the following conditions:

* Anorectal malformations * Cloacal malformations * Hirschsprung disease
* Fecal incontinence * Constipation * Pelvic tumors * Trauma to the colon or rectum

Expected Outcomes

The expected outcomes of pediatric colorectal and pelvic reconstructive surgery vary depending on the specific condition being treated. However, most children who undergo these procedures experience significant improvement in their symptoms.

Pediatric colorectal and pelvic reconstructive surgery is a complex and challenging field of surgery. However, it is also a rewarding field, as it can help children to live full and active lives. If your child has a colorectal or pelvic condition, it is important to seek the advice of a qualified pediatric colorectal and pelvic reconstructive surgeon.
